Description

The current data set refers to the study of fossil fish material from Southwest Ireland (Placodermi, Antiarchi; Givetian of the Iveragh Peninsula). The data consist of SEM elemental mapping (section 1), CTscan image stacks and subsequent working files (i.e. segmentation, visualisation files, STLs and 3D PDF files; sections 2-5), as well as phylogenetic analyses related to the genus Bothriolepis studied in the article (section 6).

* Zoobank LSID for article: urn:lsid:zoobank.org:pub:0438B3D4-AEAA-4000-A1CB-B5DA0ECA466F

* Zoobank LSID for taxon Bothriolepis dairbhrensis:

urn:lsid:zoobank.org:act:B577F075-1EF6-48A5-8C7C-E64E36E2BC4E

The dataset corresponding to the article

Dupret, Byrne, Castro, Hammer, Higgs, Long, Niedźwiedzki, Qvarnström, Stössel & Ahlberg. In Press. The Bothriolepis (Placodermi, Antiarcha) material from the Valentia Slate Formation of the Iveragh Peninsula (middle Givetian, Ireland): morphology, evolutionary and systematic considerations, phylogenetic and palaeogeographic implications. PLOS ONE.

with the LSID urn:lsid:zoobank.org:pub:0438B3D4-AEAA-4000-A1CB-B5DA0ECA466F

and the species Bothriolepis dairbhrensis Dupret, Byrne, Castro, Hammer, Higgs, Long, Gzegor Niedźwiedzki, Qvarnström, Stössel & Ahlberg

with the LSID urn:lsid:zoobank.org:act:B577F075-1EF6-48A5-8C7C-E64E36E2BC4E

is composed of the following files:

1. Elemental analysis (SEM)

equipment: Hitachi S-3600N Scanning Electron Microscope (SEM); JPGS are original output.

2. CT-scans datasets

In London, the material was CT-scanned with a Nikon HMX ST 225 system, Nikon Metrology, Leuven, Belgium, with a tungsten reflection target. Detailed settings files were adjusted for each specimen

and are given in associated documentation "S2 Table-scan properties.xlsx". Two specimens required stitching performed with an in-house NHM script written in Octave. In Oslo, the scanning was carried out with a Nikon Metrology XT H 225 ST microfocus CT instrument at the Natural History Museum, University of Oslo, at 160-220 kV, 1 s exposure time, 3016 projections, and with tin filters of varying thickness. Voxel resolution was 75 µm or better. Detailed settings are given in associated documentation "S2 Table-scan properties.xlsx".

3. Drishti and Mimics files (segmentation)

4. STL files

5. 3D pdfs

In Mimics, each individual structure corresponding to a mask was used to generate a high quality 3D object, itself transformed into an STL file. Each 3D object was duplicated and relocated in the 3D space; once again STLs were generated. The STL files were then imported into Materialise 3-matic (v. 15.0) and were reorganised into anatomical ensembles (head, fin, etc.) in both original and correct positions. Each STL surface was then simplified and corrected using the following functions: Filter Sharp Triangles with filter distance 0.01; Filter Small Edges with filter distance 0.01; Improve Mesh with shape quality high/medium, maximum geometrical error 0.07, and maximal edge length 20.0. A 3D pdf file was finally generated and open in Adobe Acrobat to take pictures used in figures of the current article.

for the following specimens

a. NMING:F35203-UU210ab_HQ

Bothriolepis dairbrensis sp. nov. Incomplete lateral plate and fragment of indeterminate plate. Segmentation in Mimics, treatment of STLS and 3d PDF exportation in 3-matic. The scale of the reference cube edges is 10 mm.

Please note that within the Mimics project files for this specimen µm is incorrectly given as a base of measurement when it should be mm (millimeters). All other processing has been performed treating the source data as being scaled in millimeters.

b. NMING:F35229-CH003

Bothriolepis dairbrensis sp. nov. Assemblage of indeterminate plate and indeterminate scavenging gastropods. Segmentation in Mimics, treatment of STLS and 3d PDF exportation in 3-matic. The scale of the reference cube edges is 10 mm.

c. NMING:F35216-UU SFB001

Bothriolepis dairbrensis sp. nov. Proximal segment of the pectoral fin, with AVL and articular condyle. [ORG] corresponds to plates in original position; [RELOC] corresponds to plates relocated in life position. Segmentation in Mimics, treatment of STLS and 3d PDF exportation in 3-matic. The scale of the reference cube edges is 10 mm.

d. NHM P 59677 (complete, ORG end RELOC files)

Bothriolepis dairbrensis sp. nov. Incomplete head (and endocranial processes), ventral body armour and proximal segment of the pectoral fin. [ORG] corresponds to plates in original position; [RELOC] corresponds to plates relocated in life position. Segmentation in Mimics, treatment of STLS and 3d PDF exportation in 3-matic. The scale of the reference cube edges is 10 mm.

e. NHM P 59678

Bothriolepis dairbrensis sp. nov. Incomplete lateral and indeterminate plates of an adult individual.

The scale of the reference cube edges is 10 mm.

f. NHM P 59679

Bothriolepis dairbhrensis sp. nov. Two indeterminate fragments. The scale of the reference cube edges is 10 mm.

g. NHM P 59687

Bothriolepis dairbhrensis sp. nov. Indeterminate fragments and burrows. The scale of the reference cube edges is 10 mm.
