Description

The survey Schoolchildren's Health Habits is a part of the international research project Health Behaviour in School-aged Children, created on the initiative of the World Health Organization. Sweden participated in the survey since 1985/86.

The study includes a random sample of 11-, 13- and 15-year-olds in each country. The survey covers questions about health, lifestyle, the environment at school and at home. The results are used to monitor the children's and young people's health over time and to identify areas requiring action to promote child and adolescent health. School children's health habits is a basis in the follow-up work in the public health policy goal area three, children and young people's living conditions.

The study that was conducted in 1993/94 is based on data from 11-, 13- and 15-year-olds, collected in November and December 1993. The survey was answered by 3,584 students in Sweden, representing a response rate of 85 percent.

Purpose:

The purpose with Health Behaviour in School-aged children is partly to increase the knowledge of habits and conditions that are considered to be important for children's health, and partly to monitor progress over time and to make comparisons with other countries.

Data contains personal data

No

Unit of analysis

[Individual](#)

Population

School children aged 11,13 and 15 years residing in Sweden.

Time Method

[Cross-section](#)

Sampling procedure

[Probability: Cluster](#)

Urvalet görs för varje årskurs med en klusterdesign i två steg. Först väljs ett antal skolor ut på ett slumpmässigt sätt så att de är representativa för landet. Därefter slumpas en klass på respektive skola.

Time period(s) investigated

1993-11 - 1993-12

Number of individuals/objects

3584

Response rate/participation rate

85%
