Description

This is the fifth study in a series of annual surveys on road safety conducted since 1981. The study is conducted by Statistics Sweden on behalf of the Traffic Safety Board, which had the overall responsibility for road safety in Sweden in 1985. Today the study is conducted on behalf of the Swedish Transport Administration.

The study aims to identify and analyse traffic safety statistics. This is done by a written questionnaire directed to a stratified sample of the population. The study from 1985 had a 81,1 percent response rate and a sample of 4 737 randomly selected people aged between 15 and 84 years. Previous years the age group -75 to 84 years were not included, this group will return in future studies with four to five years.

The questions in the study include, for example, traffic behaviour and traffic patterns; attitudes to road safety and traffic rules, the relation between alcohol and traffic and child safety in traffic. Both motor traffic, bicycle and foot traffic is concerned. A total of 30 questions are used, including descriptive questions, estimation questions and attitude questions.

Purpose:

The survey aims to identify and analyse traffic safety statistics.

Data contains personal data

Unit of analysis

[Individual](#)

Population

Individuals aged 15-84 years and residing in Sweden

Time Method

[Longitudinal: Trend/Repeated cross-section](#)

Sampling procedure

[Probability: Stratified](#)

A sample of 4 737 individuals, stratified after seven age groups, was drawn from the Statistic Sweden register over the total population (RTB).

Time period(s) investigated

1985-10 - 1985-12

Variables

121

Number of individuals/objects

3843

Weighting

Variable 6 can be used as a weight to make the data representative of the whole population.

Response rate/participation rate

81.1%
