## Research principal

[University of Gothenburg](#)

## Description

Grain tithe (Swe: Spannmålstiondet) has often been used as an indicator of crop development. It was a tax based in the principle of one-tenth of the harvest. This database is based on the accounts of the Crown's share of the tithe for Sweden in present-day borders excluding Scania. The databases relate to the period from and including 1665, when the volume measures were uniform in the country, until the tithe was a fixed tax without further linked to harvests. The transition to the tenth occurred successively in different provinces and was essentially completed by the mid-1700s.

## Data contains personal data

No

## Language

[Swedish](#)

## Unit of analysis

[Household](#)

## Sampling procedure

[Total universe/Complete enumeration](#)

[Probability: Systematic random](#)

## Time period(s) investigated

1665 - 1800

## Variables

14

## Data format / data structure
